SUMMARY

Graduating Computer Science student and DOST-MERIT Scholar with full-stack software engineering and machine learning experience, including a Software Engineering internship building production systems and APIs.

EDUCATION

De La Salle University Manila

September 2022 – Expected December 2026

Bachelor of Science in Computer Science Major in Software Technology

- **CGPA: 3.688 / 4.000**
- **Magna Cum Laude**
- **Consistent Dean's Lister**

EXPERIENCE

Springboard Philippines

May 2026 – July 2026

Software Engineering Intern

Manila, PH (Hybrid)

- Designed a **~60-model** PostgreSQL schema and **28 controllers** powering **~35 API routes** for **LEDGR**, a double-entry accounting system spanning chart of accounts, transactions, **6 journal types**, invoicing, and a **~60-report** catalog, with balances maintained entirely by Postgres triggers.
- Built the Discord ingestion pipeline and RAG-based chatbot backend for **HopSpring**, shipping **5 core features** (scrape, chat, summarize, dm, digest) with image captioning, backed by a Pinecone vector store and a hosted LLM.
- Developed the backend controllers, routes, and API calls for **CompassDesk**, a three-actor AI-assisted ticketing platform where the AI resolves low-priority tickets in real time and routes complex or customer-requested escalations to handlers.

PROJECTS

Story Reading Companion Chatbot for Children (STELLA)

Technologies: *APIs, Python, LLM, PineconeDB, RAG*

- Chunked story text into segments calibrated to **grade-level reading-speed benchmarks**, then retrieved passages via **PineconeDB similarity search** to both ground chatbot responses and flag off-topic questions.
- Improved prompt design and response validation, increasing message classification accuracy **from 50% to 83%**.

Enrollment Management Website (D-Enroll)

Technologies: *React, Node.js, Express.js, MongoDB, Docker, gRPC*

- Built a web-based enrollment system with dedicated student and professor interfaces, implementing **8 core features** including enrollment, curriculum audit, and grading, integrating the frontend with gRPC-based backend services in a Docker-based microservices architecture.

Participant Data Management Web System (Pharmalytics Profile Tracker)

Technologies: *React, Node.js, Express.js, MongoDB, GitHub Actions, CI/CD*

- Served as Product Owner and Business Analyst on the original **Pharmalytics** team of 8, working with the client to define requirements and design wireframes for **10+ screens**.
- Later became sole maintainer, redesigning auth into a **3-role** (admin/encoder/viewer) access-control system, migrating hosting to Render and MongoDB Atlas, and standing up a Playwright-based CI/CD pipeline with automated backups, while fixing a session-leak bug that had been crashing the server.

SKILLS

Languages Python, JavaScript, TypeScript, Java, C, C++, Kotlin, Ruby

Web React, Node.js, Express.js, PostgreSQL, MongoDB, MySQL, Prisma, Supabase

AI / Data RAG, Embeddings, LLM APIs, PineconeDB, Hugging Face, Google Generative AI

Tools Git, Docker, GitHub Actions, CI/CD, Jest, Playwright
